

LOCALLY × FAYSAL STUDIO

Good brands deserve a smoother way to shop.

A focused review of the app and website—
from first tap to final order.

SEPTEMBER 2026 / PRIVATE REVIEW

The idea is strong. The journey has leaks.

Locally brings many Egyptian labels into one place. Try On and Reels could make it feel different from a standard store.

01

WAIT

A 30–60 second app launch and slow videos can lose people before they browse.

02

FIND

Campaigns and brand logos look bold, but products and next steps need a clearer path.

03

TRUST

Try On is unreliable in this test; checkout makes address and payment harder than needed.

The opportunity

Keep the attitude. Remove the moments that make shopping feel like work.

The first minute should not be a loading screen.

30–60s observed launch

That is enough time for a shopper to leave before seeing a product. The next screen uses a lot of black space to ask for location, without showing what they gain.

Also in account creation

No Google, Apple or Facebook sign-in in the tested flow.

Make the first tap easy

Load the home shell first; defer heavy media. Offer guest browsing and quick sign-in. Ask for location when delivery context is useful.

Big campaign energy. Small shopping cues.

What a shopper sees

The hero fills the screen. Products sit further down. A moving promo strip competes with the bottom navigation.

The brand grid looks good, but logos alone do not tell a new shopper what each label sells. The sparkle badges on product cards need a clearer explanation.

A cleaner first screen

One strong campaign + visible product paths + a quieter promo treatment.

A video feed cannot ask people to wait.

5–10

seconds between videos

The next clip loads slowly and appears in low quality. In a swipe-first feature, the delay breaks the rhythm—and the path from inspiration to product should be obvious.

Measurement: swipe-to-first-frame time + reel-to-product taps.

Make it feel instant

Preload the next clip

Use adaptive video quality

Show a poster while loading

Deep-link to the item

The Try On feature has to earn trust.

2

failed attempts

then a similar—but different—piece appeared on the third try.

A shopper will rarely give a feature three chances.

Before

Guide the photo: pose, lighting, framing, supported items.

During

Show progress and a clear retry path when processing fails.

After

Keep the result tied to the exact SKU, colour and size selected.

Track success rate, processing time and “add to bag” after Try On before promoting it harder.

The last step should feel like the easiest one.

Address

The address block is not tappable; the small “Edit” link is the only clear way in. No map pin appeared in the tested flow.

Payment

Selection is hard to discover, and a house icon is reused for payment and delivery.

Summary

“Estimated Total” appears twice. A 0.00 savings row adds noise at the moment of decision.

Make the address card and payment choice unmistakably tappable.

Save for later is not the same as buy now.

The bag and wishlist are merged in the tested experience. That mixes two different intentions: “I want this now” and “I might come back.”

BAG

Ready to order

Size, quantity, delivery and a clean route to checkout.

SAVED

Maybe later

A place to compare, revisit and move an item into the bag.

Separating them is a small product decision with a clear shopper benefit: less confusion near checkout.

The site looks alive. The path could be calmer.

Two navigation rows + a moving message bar + a full-height campaign compete before the first product choice.

Keep the strong art direction; simplify the top choices, reduce moving distractions, and make product categories or best sellers easier to reach on mobile.

The website also makes people wait.

13.7s

First Contentful Paint

12.6s

Time to First Byte

These figures are from the supplied mobile report, not an app benchmark. Diagnose server response first, then media weight and critical rendering.

Fix what costs a sale first.

01 REMOVE THE WAIT

Measure cold start; improve the first usable screen. Tackle website server response and critical rendering. Preload the next Reel.

Track: app start, FCP/TTFB, video first frame

02 CLEAR THE PATH TO ORDER

Make address and payment easy to edit. Add a map-pin option where useful. Separate bag from saved items; reduce signup friction.

Track: checkout completion, payment selection

03 MAKE TRY ON WORTH REVISITING

Test failures across garments and devices, keep results tied to exact products, add clear recovery, and connect Reels to product pages.

Track: Try On success, add-to-bag after use

Same traffic. More orders.

The next move

A focused sprint: fix load time, stabilize Try On, simplify checkout, then tune discovery and Reels.

We would baseline app starts, Try On success, checkout completion and web conversion first. No sales outcome is guaranteed.
